

Ozone Widget Framework

What is a widget?

A widget is a lightweight, single purpose, web-enabled application. Widgets are useful because they allow access to specific information without having to launch a large application.

Intercommunication:

By making widgets intercommunicate, certain data can be accessed in one widget which causes relevant data to be displayed in another. For example, by clicking on a certain location on a map widget the weather of that location would be displayed on a weather widget.

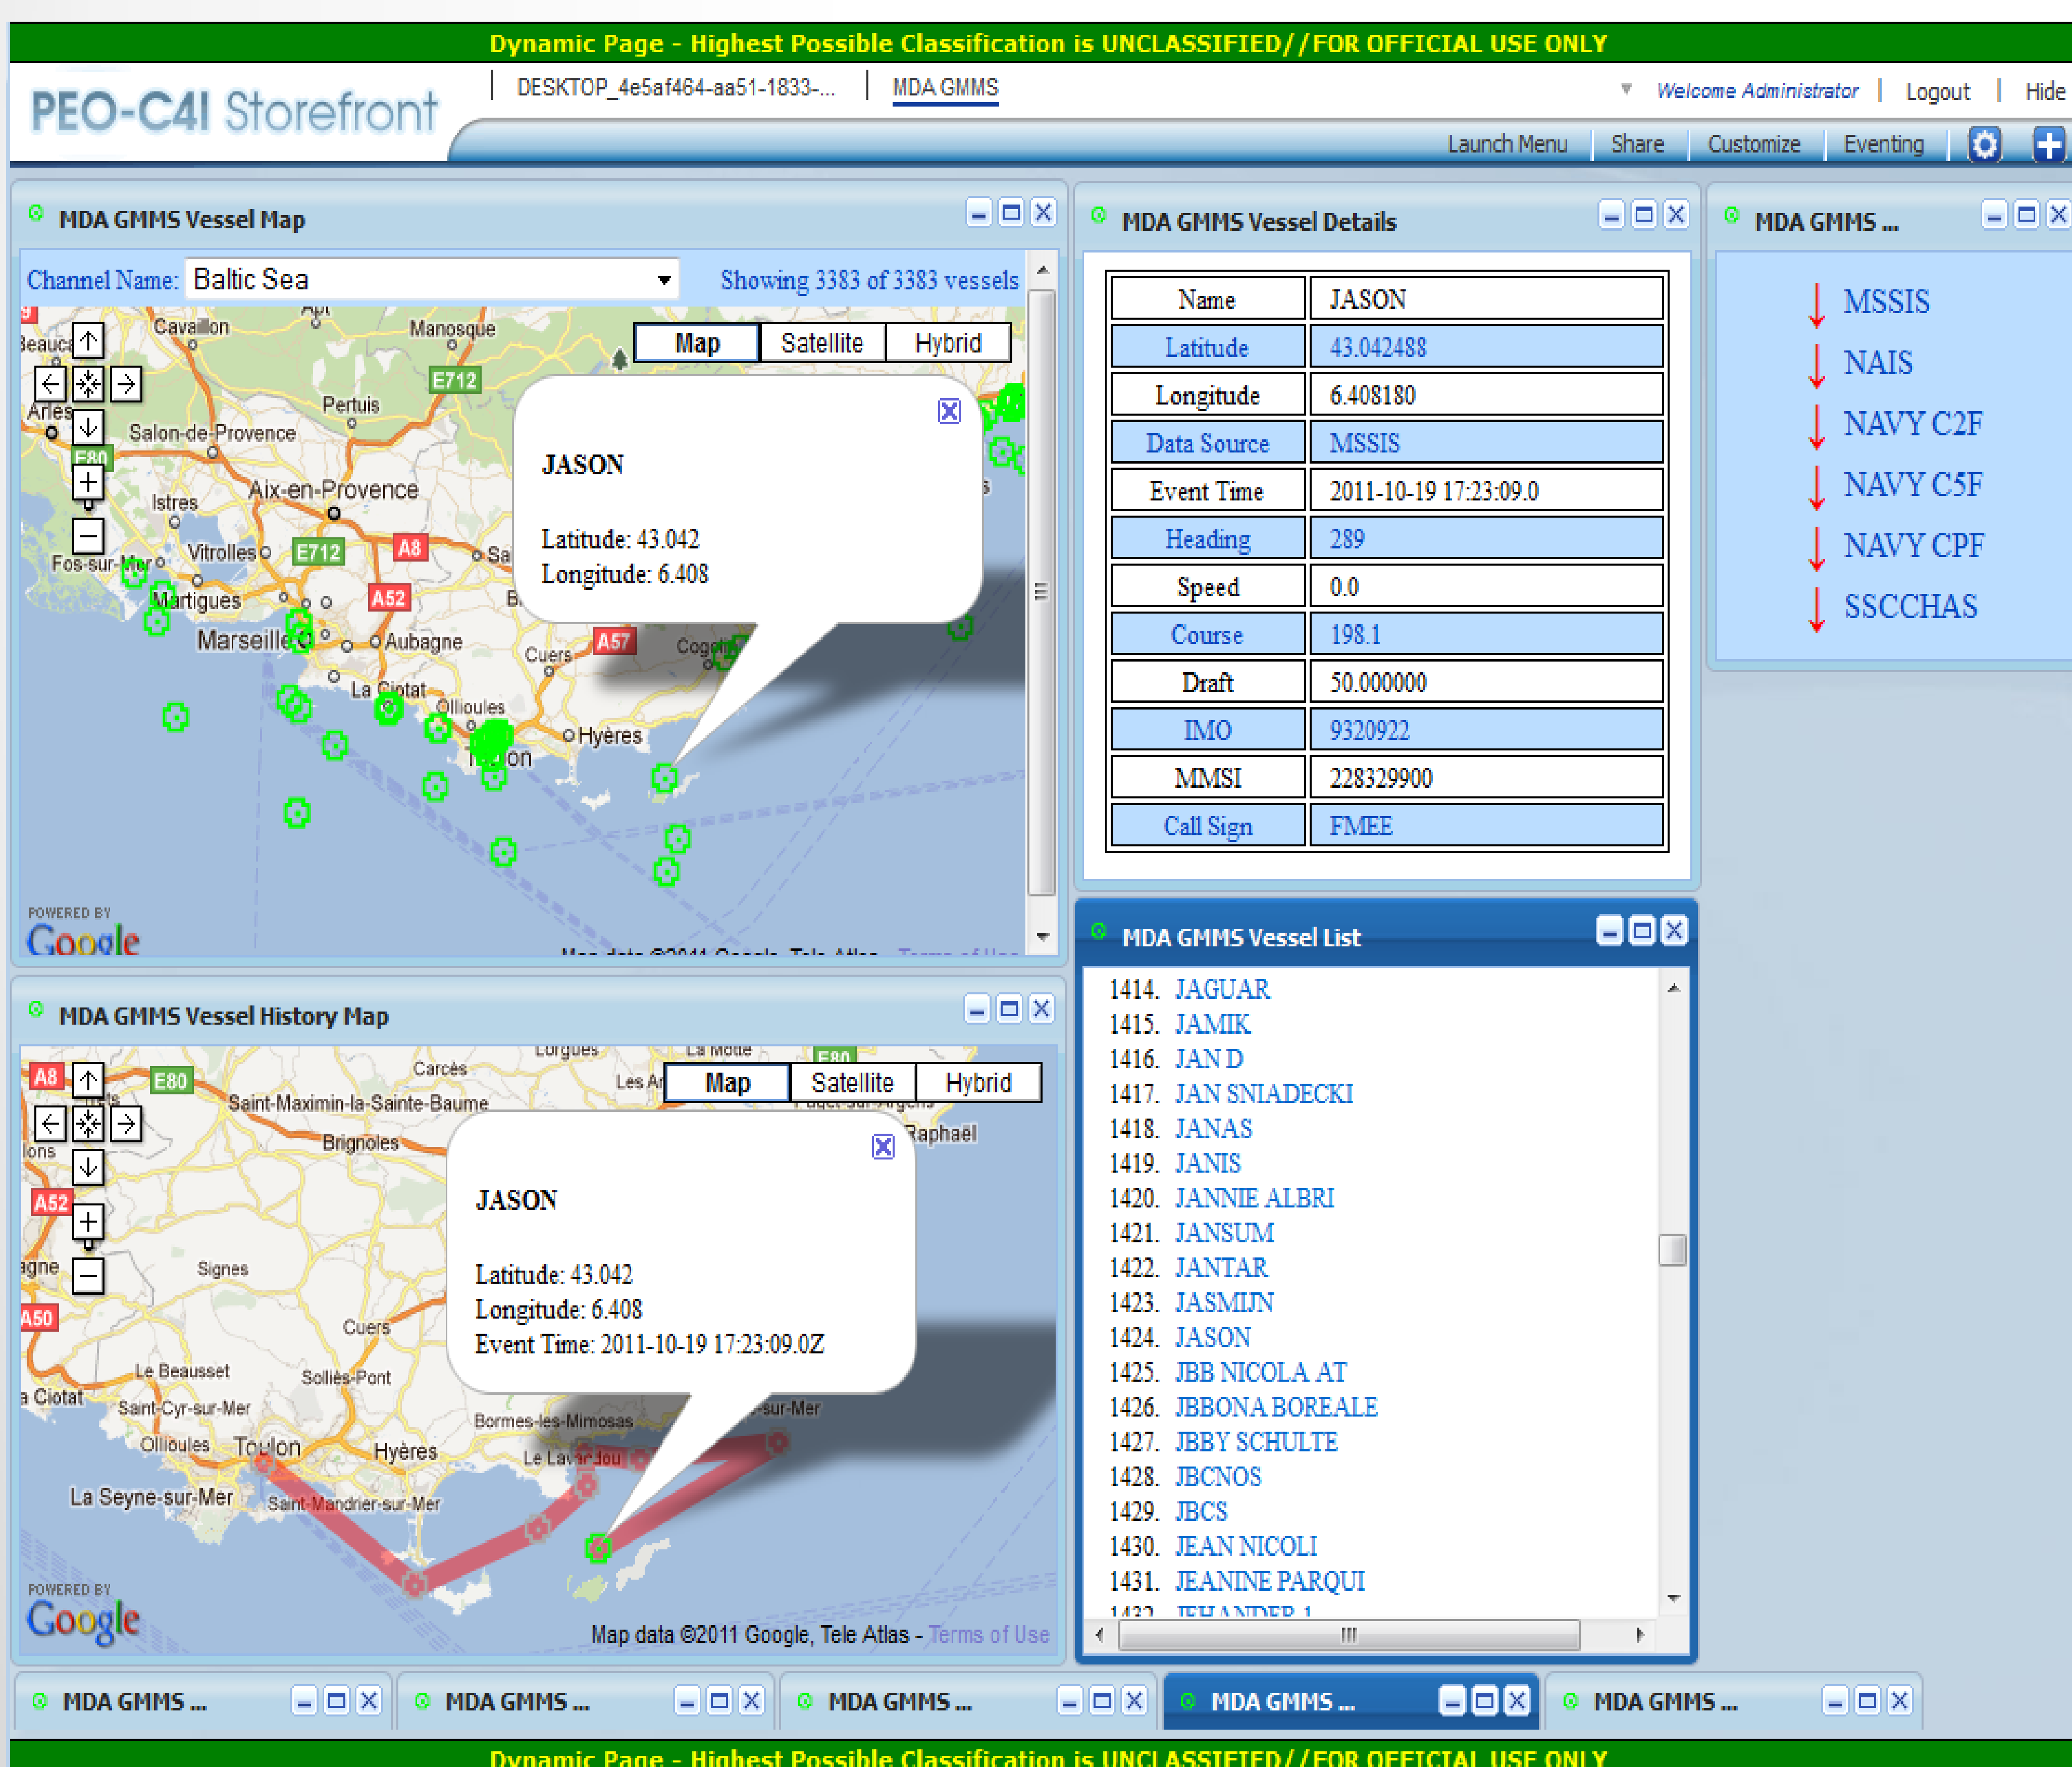

Ozone Widget Framework:

Ozone Widget Framework is a platform that offers infrastructure services to simplify the development of workflows and presentation-tier application integration.
